BA Mart APK

Reverse-Engineering Summary

Application identity, observed behavior, permissions, and recovery limits

---

Application identity

- App label: **BA Mart**
- Branding: **BA e-Mart - One App, Multiple Services**
- Android package: `com.bamart.app`
- Version: 1.0.0 (version code 16)
- Framework: Flutter; compiled Dart AOT snapshot at `lib/arm64-v8a/libapp.so`
- Main activity: `com.bamart.app.MainActivity`

What the app does

The APK is a BA Mart customer shopping application. Its Flutter shell includes splash and offline assets and a WebView page implementation. Evidence in the compiled app indicates that the shopping experience is served as a web application.

Observed web addresses and routes

- `https://cgdemo.sbs/ba-mart-crm/ba-mart-app/`
- `https://cgdemo.sbs/ba-mart-crm/ba-mart-app/customer/login`
- `customer/login and customer/reset-password`

Recovered Flutter source references

- `package:ba_mart/main.dart`
- `package:ba_mart/splash_screen.dart`
- `package:ba_mart/webview_page.dart`
- `package:ba_mart/no_internet_page.dart`
- `package:ba_mart/deep_link_service.dart`

Declared permissions and components

The Android manifest declares access to the internet and network state, coarse and fine location, camera and autofocus, phone calls, audio recording, media/images/videos, and external storage. It also includes WebView and deep-link components and an Android FileProvider.

Source-code recovery limits

The APK does not contain the original Dart project files. Flutter release builds compile Dart code into an ahead-of-time snapshot, so the original source files, comments, variable names, and exact project structure cannot be reliably reconstructed from this APK. The extracted APK files and assets are retained in the accompanying `_apk_analysis` directory.

Assets found

- assets/flutter_assets/assets/splash.png
- assets/flutter_assets/assets/logo.png
- assets/flutter_assets/assets/icon.png
- offline/error illustration assets
